

Hagmann & Hagmann Report with Dr. Ted Broer – July 25th, 2015

July 30, 2015

This is the transcript of the first 29 minutes of [my edited recording](#) on nagalase and GcMAF. About 28 minutes were removed from the beginning of the recording. This document [can be found here](#).

I felt this material on nagalase and its role in blocking the formation of GcMAF in the body was so critical that I have transcribed this section – despite, I have to say, the fact that Ted speaks like a misfiring machine gun...

There is also a lot of important information in the latter part of the recording regarding what Ted calls the Eugenics Protocol, explaining some of the other ways the human population is being reduced. One he discusses in detail is fluoride in our water and elsewhere. It is NOT about preventing tooth decay, but is about reducing human fertility. A side effect is that it interferes with the development of the male foetus, leading to a dramatic rise in confused gender (ever wondered why homosexuality is so much more widespread, today?). I have also seen this spelled out elsewhere. So, whilst the rest of the recording has core information, I have only transcribed the nagalase section. If someone else wants to take that on to complete this, please contact me at richard@richardpresser.com.

The original recording can be found at [Hagmann and Hagmann Report](#) and my edited version can be [accessed here](#).

The transcript:

Doug Hagmann

You're listening to a very special Saturday night edition of the Hagmann and Hagmann Report. Our special guest tonight, Mr. Ted Broer. People know Ted Broer of <http://healthmasters.com/>; Ted, fire away.

Ted Broer

Thanks, Doug. I want to read a disclaimer before we get started on this.

Tonight's presentation is for alternative news sources only. These are my opinions or the opinions of the articles and the research papers that I'm going to read to you guys tonight. I am not making any claims concerning GcMAF. I have never sold GcMAF. I don't even know where to buy GcMAF. I have never used GcMAF. It is not available from any source that I know, and the only company that I know that was making it in Europe has been shut down last month when these doctor started to die.

Now, let me give you some information on what happened here. In the last few weeks and the last month, several alternative doctors here in Florida have died. They have died mysteriously and nobody really understands why they died. It was either linked to suicide or to heart attacks and just finding them dead in cars, and all of these doctors that have died in Florida, apparently were interlocked through Dr. Gonzales and Dr. Bradstreet. And what they were doing is, they were doing extensive research on autism and what was causing autism.

Now, I want you guys to get a sheet of paper and pencil because the information I'm about to give you, right now, is extremely controversial and a bunch of people have exited the planet who were working

with it. This information has been around for a while. They knew the information they were working with and they were basically being very, very careful - supposedly – and some of them were being accused of having used GcMAF, and the FDA apparently raided several of their offices, several weeks before they committed suicide or suddenly died.

Now, let me share something with you very quickly, what this is. And this is going to sound complicated; I'm going to break this down super, super easy for everybody listening tonight. When you first hear these terms, they're going to sound weird to you, but we're not going to make them weird; we're going to make them very easy.

Gc protein is a protein in the body that is used by macrophages in the body, and what it does: macrophages in the body are the ones that kill cancer cells. They basically stop cytokine storms and can be involved cytokine storms. We'll explain what all these terms mean in a few minutes. The Gc protein in the body adds vitamin D to it. Doug, how many times have I told the listening audience - you have to take vitamin D every single day. That's super important and we've got another bunch of notes, too. We're going to talk about the other ways that that they're doing things to us to reduce the population of the planet.

Now, what's interesting about this is; remember Gc protein gets vitamin D added to it and the Gc protein becomes what's called GcMAF. This GcMAF protein is human immune system enzyme protein, also known as vitamin D binding protein **Macrophage Activating Factor**. Now, what that simply means is this: this GcMAF is probably the single most effective thing in the immune system to kill cancer cells, and what's happening is the immune system is being compromised by a product called nagalase. It's an enzyme/protein and it's made by cancer cells and viruses, causing immunodeficiency syndromes. It's also been linked to autism and a host of other problems we're going to talk about tonight.

Now, what is happening is this: when this Gc protein cannot be converted to the GcMAF protein, the entire immune system is compromised. What these doctors found was this: that this nagalase protein/enzyme they felt was being introduced into the body either virally or directly through immunizations. This is the enzyme/protein that destroys the immune system. I'm going to repeat this.

Apparently, since these guys are dead and I can't talk to them; they had found that the nagalase enzyme/protein that was made by cancer cells and viruses, which causes immunodeficiency, is being added through the immunizations, either through viruses or through the immunization itself being given nagalase.

This is such incredibly damning information for the entire medical profession and the immunological profession and those folks that are producing immunizations that, apparently, they didn't want these guys around. Now, I'm not saying what happened to these guys, I'm just saying they're not on this planet anymore.

So, what ends up happening is this: the Gc protein cannot attach itself to vitamin D because of the nagalase. When that happens, the nagalase becomes the agent that causes the cancer.

Now, let's talk about nagalase for a second. We know that nagalase is being found in super high concentrations in autistic children, and what they're saying is that **the nagalase protein, this viral protein was not in these children at childbirth, but it's being introduced, somehow, into these**

children, they felt during the immunization process. Now, again, I wasn't involved in their research, I haven't seen the double-blind clinical studies.

I'm going to read you some information on nagalase. Nagalase is a protein made by all cancer cells and viruses. Its official name is – now it's a long name - is alpha-N-acetylgalactosaminidase. Let's just call it nagalase for this tonight. Now, nagalase causes immunodeficiency. It was being found in children being diagnosed with autism in high concentration. Nagalase blocks the production of the GcMAF, which is the vitamin D binding to the Gc protein. Thus, it prevents the immune system from doing its job. Without an active immune system, cancer and viral infections can grow unchecked.

As an extremely sensitive marker for all cancer, nagalase provides a powerful system for early detection. Serial nagalase testing provides a reliable and accurate method for tracking the results of any therapeutic regime for cancer, AIDS, or other chronic infections. This is an article from a book from Dr. Tim Smith M.D. He goes on to say – now, this is super important, guys, listen to me on this – he says that nagalase is like a stealth bomber. The nagalase enzyme synthesized in and released from cancer cells or a virus particle pinpoints the GcMAF protein facilities on the surface of your T and B lymphocytes – this is part of your immune system - and simply wipes them out with an incredibly precise “bomb” is what he says. How precise? He says, “let me put it this way: nagalase locates and attacks one specific 2-electron bond located at and only at the 420th amino acid position on a huge protein molecule, one of tens of thousands of proteins, each containing millions of electrons. This is like selectively taking out a park bench in a major city from 6,000 miles away. More astonishing, if that is possible, nagalase never misses its target. There is no collateral damage.

“As you already know, GcMAF is a cell signalling glycoprotein that talks to the macrophages, enabling them to rapidly find, attack and kill viruses and cancer cells. By activating these macrophages, this GcMAF protein triggers a cascade that activates the entire immune system.”

When you block the production of this protein, Doug, this nagalase brings all of this wonderful anticancer, antiviral immune activity to a screeching halt, allowing cancer and infections to spread.

These doctors apparently felt that this nagalase was being introduced via immunization, either viral or through nagalase itself being directly injected into the children who were developing autism, who had very high nagalase at the very beginning of the autistic cycle, immediately after the immunizations.

So, what they're saying is, there's a smoking gun here with nagalase and the compromised immune system.

The GcMAF for the treatment of cancer – this is another article and this by David Noakes - this is called [GcMAF \(it's available online\) for the treatment of cancer, autism, inflammation, viral and bacterial disease](#). And what it says: Human GcMAF, otherwise known as Vitamin D binding protein macrophage activating factor, holds great promise in the treatment of various illnesses including cancer, autism, chronic fatigue and possibly Parkinson's. Since 1990, 59 research papers have been published on GcMAF, 20 of these pertaining to the treatment of cancer. 46 of these papers can be accessed through the [GcMAF web site](#).

GcMAF is a vital part of our immune system, which does not work without it, and is part of the blood. When you put this other product (nagalase) into the blood, it cannot produce GcMAF. Let me say that again. And so, it has been shown to help such neurological diseases as Parkinson's, Alzheimer's rheumatoid arthritis, inflammatory conditions and diabetic retinopathy.

In the case of autism, Dr. James Bradstreet has so far treated 1,100 patients with GcMAF, with an 85% response rate, Doug. This is supposed to be impossible. His results show that a bell curve response with 15% of the patients showing total eradication of the symptoms (and 15% showing no response). 15% of the autistic patients that he tested were no longer autistic. He had **total eradication** of the symptoms when they reintroduced GcMAF, which had been blocked by this nagalase. However, he goes on to say, in addition, experimental and clinical evidence confirms it. GcMAF shows multiple powerful anticancer effects that are significant therapeutic impact on most tumours. In other words, they're saying here that it reduces – they're saying it cures – breast, prostate, kidney cancers. GcMAF is created in the body by the release of two sugar molecules from a Gc protein molecule. However, tumours release an enzyme called nagalase. Nagalase degrades this protein to the point where it can no longer attach with Vitamin D.

So what's happening is, this nagalase is being introduced into the body somehow, and these doctors were saying it was through immunizations. In conclusion, the GcMAF restores the energetic balance in the cell. Cancer cells, driven by a sugar metabolism, become healthy, oxygen-driven cells, so tumour cells no longer behave as a parasitic organism. The GcMAF stimulates macrophages to consume the cancer cells and cells invaded by the viruses. This stimulation of the immune system and the anti-angiogenic effect surrounding the tumour is beneficial in cancer and several neurological disorders like autism, chronic fatigue, Parkinson's, and Alzheimer's.

He then goes on to say that it is available to the general public, which it no longer is. The laboratory producing it in Europe has been shut down. At the same time, these doctors supposedly left the planet.

This is another article by Kent Heckenlively, and it says [Dr. Bradstreet, Nagalase and the Viral Issue in Autism](#); he says in this article he wrote:

In the past months Dr. Bradstreet has become interested in nagalase, which he describes as an enzyme "produced by cancer cells and viruses." He thinks it unlikely that children with autism have undiagnosed cancers, and thus suspicion falls on a viral etiology. Dr. Bradstreet writes, "Viruses make the nagalase enzyme as part of their attachment proteins. It serves to get the virus into the cell and also decreases the body's immune reaction to the virus-thereby increasing the odds of viral survival."

Further on Dr. Bradstreet writes, "It is reasonable and likely that the nature of the immune dysfunction and the frequently observed autoimmune problems in autism are mediated by persistent, unresolved viral infections." He claims to have tested approximately 400 children with autism for the viral marker, nagalase, and found that nearly 80% have significantly elevated levels. He hopes to publish soon on this study and believes this information "is one of the most important developments in the clinical treatment of children on the spectrum that I have experienced in the last 15 years."

Of course, we know has not going to do that because he has left the planet.

I'm going to keep reading and then we're going to do some other stuff, because I want to get this information out. This is a straight article and it's from the role of vitamin D in Type II diabetes. Now, you say, what does it have to do with autism? Listen to what it says.

In recent years, researchers have linked low level of vitamin D levels to insulin resistance and diabetes. Overcoming insulin resistance, in particular, could be the way to head off Type II diabetes before it sets in. Right now, there's a lot of circumstantial evidence to suggest that giving people vitamin D may help

them with their insulin resistance. The [researchers on this article](#) are [Meredith Hawkins MD](#) and Preeti Kishore. She goes on to say:

This is super important that these macrophages, these vacuum cleaners of the immune system are specialized immune cells that attack invaders, and researchers now think may have a secondary function as a clean-up crew. When fat cells get too large they die and macrophages move to eliminate the dead tissue. That, Kishore says, may be why the cells are overrepresented in fatty tissue—and why inflammation, a sign that macrophages are at work, is often more severe in people who are overweight or obese.

I'm tying this to diabetes right now – everybody listen to me.

For people with diabetes, the latest research suggests macrophage activity can have an added drawback. Macrophages at work produce chemicals called cytokines (these cause inflammation), some of which serve as signals to other parts of the body. "They can impair insulin action in the liver and muscle," Kishore says. "Higher cytokines means more insulin resistance," a key factor in Type 2 diabetes."

Now, what also happens is this: things called a cytokine storm, when these macrophages don't get sufficient quantities of vitamin D, they start releasing huge amounts of cytokines. So, when you're giving a person these different chemicals in their diet, this nagalase, you can't get the vitamin D to attach to the macrophage, and when that happens, the macrophages induce what's called a cytokine storm, in which huge amounts of these signals - chemical messages - are sent out to the body, causing massive inflammation. This is what killed almost everybody in the Spanish flu in 1918. There was a cytokine storm in their body and their lungs filled with fluid from the cytokine storm. It was because there wasn't sufficient quantities of (vitamin) D3 to stop the macrophages from doing this. These chemicals that are now being found by the doctors were basically - they say - put into the body to prevent the attachment of vitamin D to the macrophage, which causes all these problems, including Type II diabetes and cytokine storms.

They [go on to say](#):

Kishore is working to find a way to turn down the activity of macrophages in the body (to help stop the cytokine storm). After noticing that macrophages have special receptors for vitamin D, Kishore decided to look at whether vitamin D deficiency might be making macrophages more active—contributing to insulin resistance and inflammation in the process (cytokine storms). "When you have less vitamin D, the macrophages are in a more active state," Kishore says. "We believe when you give people vitamin D, these inflammatory reactions will be reduced."

Now, one of the conditions that Dr. Russell Blaylock talks about that occurs immediately after immunization, especially with the DPT shot, is what's called in an encephalitic scream, and what happens with that, Doug, is you give this little baby like at 18 months its second or third round booster shots, and what happens is this cytokine storm hits the body, because it can't use vitamin D anymore, and it causes the brain to swell, and this little child starts screaming for hours and hours and hours, with its back arched in its bed. It happens all the time, and when you call most doctors that give these children these shots, they say, "Oh, that's normal, that will go away tomorrow."

That's called an encephalitic scream from swelling of the brain and the brain is pressing against the skull. Now, this is crazy. I mean, this is absolutely crazy that this is actually going on. And so, what she's saying is, when you increase the vitamin D levels, that all of these different symptoms end up going away. Also, when you inhibit vitamin D from attaching itself to the macrophage, you cause what's called a cytokine production and phosphatase, which massively increases inflammation in the cardiovascular system, leading to cardiovascular disease and atherosclerotic plaquing.

So, what I'm saying is that when you give this chemical into your body, this nagalase, it causes atherosclerotic plaquing, heart disease and diabetes, and it causes you to die from these diseases much younger than you normally would.

Here's another article. This is a very, very good article that was written by Jisu Oh⁵, Amy E. Riek⁵, Isra Darwech, Katsuhiko Funai, JianSu Shao, Kathleen Chin, Oscar L. Sierra, Geert Carmeliet, Richard E. Ostlund Jr., Carlos Bernal-Mizrachi in the article is [Deletion of Macrophage Vitamin D Receptor Promotes Insulin Resistance and Monocyte Cholesterol Transport to Accelerate Atherosclerosis in Mice](#).

In other words, when you have this nagalase in your body, your vitamin D is no longer attached to the macrophages, to the clean-up crew you, and you have massive inflammation of the cardiovascular system, and you massively accelerate atherosclerosis and heart disease and death in human beings.

So, this is what these doctors were working on. They were linking all of this to all of these diseases that are being used by the New World Order through the eugenics protocol to kill a bunch of us, to reduce the population of the planet. That's why these guys - as far as I'm concerned - are no longer on the planet.

This is another update and this is from [another website](#), and it says, update July 2015 GcMAF is no longer available as the company that made it was shut down by overseas regulatory agencies. And it goes on to say that the role of GcMAF and the role of the immune system, research shows that GcMAF can reverse other diseases that attack the immune system like autism, chronic fatigue syndrome, Lyme disease, AIDS, HIV, fibromyalgia, which have all began to have success, osteoporosis, Hodgkin's, lupus, MS, Parkinson's - on and on and on - and it says that nagalase is an enzyme that prevents vitamin D receptors from being activated on the surface of the macrophage. As a result, macrophages are not activated and the immune systems are not properly able to respond to the invaders.

Now, that's what all of the articles are saying that I've dug off the Internet and that were sent to me concerning what these doctors were killed over, and this is what people need to realise.

I'm going to give you one more thing, and this is on cytokines and I'm going to read you what it says [on Wikipedia](#) and it says, cytokines are a broad and loose category of small proteins (~5–20 kDa) that are important in [cell signalling](#). They are released by cells and affect the behaviour of other cells. Cytokines can also be involved in [autocrine signalling](#). (Cytokine storms)

It goes on to say, Adverse effects of cytokines have been linked to many disease states and conditions ranging from [schizophrenia](#), [major depression](#)^[18] and [Alzheimer's disease](#)^[19] to [cancer](#).^[20] Normal tissue integrity is preserved by feedback interactions between diverse cell types mediated by adhesion molecules and secreted cytokines; disruption of normal feedback mechanisms in cancer, threatens tissue integrity.^[21] Over-secretion of cytokines can trigger a dangerous syndrome known as a [cytokine storm](#); this may have been the cause of severe adverse events during a clinical trial of [TGN1412](#).

Cytokine storms also were the main cause of death in the [1918 "Spanish Flu"](#) pandemic. Deaths were weighted more heavily towards people with healthy immune systems, due to its ability to produce stronger immune responses, likely increasing cytokine levels. Another important example of cytokine storm is seen in acute pancreatitis. Cytokines are integral and implicated in all angles of the cascade resulting in the systemic inflammatory response syndrome and multi organ failure associated with this intra-abdominal catastrophe.^[22]

OK, it's also been linked to tuberculosis - another article that I pulled off-line. All of these different things are a direct result of nagalase. Nagalase is the information that was being released from these doctors when they basically left the planet. And they were talking about what was going on - Bradstreet and Gonzales - and they had an interacting group of doctors here in Florida, Doug, that were all working together.

So, I'm going to repeat this again. What happens is, this macrophage cannot activate vitamin D properly. Therefore, it goes nuts and starts releasing huge amounts of cytokines, causing a cytokine storm, which then causes the encephalitic scream that these children do when they have before they come down with autism in many cases, after they get their shots. In addition to that, it has been linked to adult onset diabetes, cancer and a massive increase of heart disease, all because of this compound, this nagalase that these guys were trying to expose to all of their colleagues all over the United States. That's why we had to release this information tonight because, apparently, this is so damning to the New World Order that nobody wants us to figure out how this nagalase is getting into these children. Either it's being put in there virally through the immunization or its being directly injected; and that's what these guys apparently were thinking and, apparently, that's why they've exited the planet.

So, do you have any questions on that, Doug? I know it's complicated.

Doug Hagmann

Just to recap this and keep it simple for me, what you're saying is this GcMAF is, really, well, it's manufactured, it's found in the body naturally. It's a natural cure – well, I will be careful of my wording, here – the scientific analysis of this and treatment of this by at least one company, which has been shut down, has proven effective in the fight against autism, a treatment against autism, kidney, liver disease etc. including cancer and diabetes.

Ted Broer

So, this is like the perfect storm for the New World Order. They've got a group of doctors here in Florida that were successfully treating autistic patients - supposedly – and, you know, getting an 85% response rate with the rest of them, a 15% full cure rate, and now they're finding that, you know, these guys, you know, departed the planet because of depression or whatever.

Now, the craziest thing is this: I'm not depressed, I don't take drugs, my blood pressure is great, I'm not on tricyclic antidepressants or serotonin uptake inhibitors, I have no interest in suicide. All I want to do is get this information out. So, I want everybody to know that I am happy and healthy and I do great, I feel great. My heart, my cardiovascular system is in great shape. So, I'm not planning on leaving the planet right now, OK, but what I do know is this: is that this is a very, very important topic to get out too everybody, and this show's going to do it because we're linking it to our website - you know

<http://healthmasters.com/> and we'll be linking it to your website, Dave Hodges is going to link it to his website...

So, what's happened here is there is a massive blowback towards these doctors that have suddenly expired because they were working with the results of trying to figure out how nagalase got in the body, because it completely overrides the immune system, Doug. Once it goes into the body, it starts shutting down all of this vitamin D synthesis into these macrophages and the body simply can't heal itself. Period. It won't work. It can't do it. You die.

Doug Hagmann

All right, let me ask you this. Nagalase - has this been recently introduced via vaccine in the body – bodies of children, adults, whatever or has this nagalase been around for decades?

Ted Broer

Nagalase is the substance that cancer cells produce to turn off the immune system in the human body, and what they found was this: after these children were receiving these shots, and they didn't have high nagalase levels, but after they got the shots, they checked their nagalase and it was through the roof - sky-high - and they were diagnosed with autism. So, what the doctor is saying is, where is this nagalase coming from? Either there's a viral implication in the immunization – now, we already know that the simian 40 (SV-40) cancer virus was put into the polio vaccine back in the 60s and 100 million people in the United States have a much higher risk now – it's in their genetic markers, now, and it's also epigenetic, it's transferred to the next generation, and now we have a huge increase in bone, breast and brain cancer in the United States, and this is what the simian 40 vaccine causes. It was already put into the polio vaccine back in the 60s. (I believe the presence of SV-40 was accidental, but the vaccines were not removed when it was identified, along with its consequences – Richard.) They've already done this once, so these guys were trying to find a smoking gun. Why, right now we have 1 in 58 children have autism. And now, a lot of you are saying, "What difference does that make? My child doesn't have autism."

Everybody, listen to me for second. California just passed a law that if you put a child into the school system, you no longer have the right for religious exemption or a philosophical exemption. You have to immunize these children. Now they're trying to pass a law in California that's going to force you as an adult to take vaccines. Now, when all of this happens, Doug, they can introduce anything they want into these vaccines. I remember a couple years ago with the H1N1 and all of the different things that were being introduced into Europe. All of a sudden they found an entire shipment that had gone into Poland - you remember this – that it had live virus in it. Live virus. And what this stuff does, these viruses, they start impairing the body, causing cancer, releasing this nagalase, and these guys were trying to figure out the relation between the nagalase and the viruses, whether the nagalase itself was being introduced. You see, once the nagalase goes into the body, the body shuts down these B receptor sites on these macrophages, with these vacuum cleaners. And so, they don't work anymore and so they start releasing all these cytokines, leading to these encephalitic screams and also causes all the inflammation that's been associated with heart disease and with diabetes.

Now, we know already, that the cause of heart disease is inflammation. How many people go out every single year and get flu shots? We have absolutely no idea what those flu shots contain, Doug. It doesn't

matter what the label said. Unless you have it assayed and broken down in the laboratory, you don't know what happened. And that's what happened in Europe a couple of years ago. They got these hundreds of thousands of vials of vaccines in, and some guy at the lab says, "You know, I'm going to test this stuff, and see what the heck's in this crap." And he says, "Oh, my God, it has live virus in it." And so, they say, "Oh, we made a mistake."

That's not a mistake. That stuff doesn't happen. I have 400 hours in the biochemical genetics lab at Florida State University. That crap does not happen on huge batch runs like that by accident. It doesn't happen.

Now, this is what's interesting to me. Now I want to start on the rest of the show, if you don't mind. Now, I want to talk about how this ties into what the rest of eugenics protocol is, if we have time to do that, still...
